

Dry lubricants help seeds flow through planters

Norac Concepts is pleased to introduce two new seed lubricants for use in seed planters

Glider-G is a fine grade graphite for finger planters

Glider-T is a fine agricultural grade talc for air planters

Poncho, a recently registered seed treatment for corn, provides protection against early season insects that can cause damage to corn seed and reduce plant stand and yield.

Special care should be taken when planting treated seed since the extra material applied to the seed may lead to reduced flowability, thus affecting seed placement. To ensure proper flowability, it is recommended to use graphite in finger planters and talc in air planters.

Norac Concepts is working together with your supplier to pass on information on these new

seed lubricants so you can find out more about ***Glider-G*** and ***Glider-T***.

We have created a special program that is tailored to your needs. It will provide you the opportunity to make some extra margin when you offer these products to your farmer customers as you deliver the seed for this spring planting.

Included is a copy of the program for your consideration. Since the planting season is quickly approaching, please check with your supplier or contact us to confirm your requirements for the coming season.

Product Description

- ❑ ***Glider-G*** Fine grade graphite
 - Elemental carbon
 - Very soft mineral
 - Median diameter <45 microns
 - Excellent lubricant
 - Targeted to finger planters

- ❑ ***Glider-T*** Fine grade agricultural talc
 - Chemically inert naturally occurring platy material
 - Median diameter ~15 microns
 - Superior anti caking and flowing agent
 - Designed specifically for agricultural use
 - Targeted to air planters
